CostReduction@work

partners in cost reduction

Are you **spending too much** of your **budget on floor stocks**?
Can't you get the consumption of the floor stocks **under control**?
Do you **suspect that the floor stocks are being abused**?

Do you want **an efficient solution** to the above problems?

Vendimat vending machines

We make automatic vending machines available for the supply and distribution of products on the work floor. This guarantees the constant availability of the correct tools to ensure safe and efficient working practices. The vending machine has a rotating carousel with 12 platforms, each platform has been subdivided in at most 36 compartments. Their size can be easily adjusted.

Identification - selection - reporting

Products can be supplied freely to staff with the vending machine. The staff member puts his or her personal badge in the machine and selects the required item. The badges can be programmed in accordance with the competences/requirements of the user in consultation with the Maintenance, Repairs and Operations (MRO) department. These may mean restrictions in the area of products and the workplace. Incorrect products for a specific application can be excluded in this simple manner.

The vending machine supplies the product and saves the transaction data (product, dates/times of the supply, personnel identification, etc.) in a database.

The system owner can retrieve the saved transaction data through a mobile phone modem. Reports can be retrieved online and exported in PDF, Excel, etc., to be further processed.

Customer-specific configuration

The vending machines are configured based on customer requirements in consultation with the customer. The machines are presented in a buying system wherein the buyer pays the selling price.

In addition, there is a leasing system where the customer leases the machines for 36, 48 or 60 months.

The customer will be the owner of the machine after the leasing period.

We will, naturally, always be accessible for the required support and interventions.

Cost savings

Abuses can be quickly detected because of the processing of the transaction movements per department, supply machine and period.

The constant adjustment of the consumption/requirements will save on costs.

Floor stock consumption can be stimulated negatively within this context, which results in important cost savings being achieved.
